

## 具有 IEC ESD 保护的 SN65HVD7x 3.3V 电源 RS-485

### 1 特性

- 可提供小尺寸的 VSSOP 和 SOIC 封装，前者可节省电路板上的空间，后者可实现普遍兼容性
- 总线 I/O 保护
  - $>\pm 15\text{kV}$  人体模型 (HBM) 保护
  - $>\pm 12\text{kV}$  IEC 61000-4-2 接触放电
  - $>\pm 4\text{kV}$  IEC 61000-4-4 快速瞬态突发
- 扩展的工业温度范围  
-40°C 至 125°C
- 用于噪声抑制的较大接收器滞后 (80mV)
- 低单元负载可实现超过 200 个节点的连接
- 低功耗
  - 低待机电源电流:  $< 2\mu\text{A}$
  - 运行期间  $I_{CC}$  静态电流  $< 1\text{mA}$
- 与 3.3V 或 5V 控制器兼容的 5V 耐压逻辑输入
- 针对以下信号传输速率进行了优化:  
250kbps, 20Mbps, 50Mbps
- 无干扰加电和断电总线输入和输出

### 2 应用

- 工厂自动化
- 电信基础设施
- 运动控制

### 3 说明

这些器件具有稳健耐用的 3.3V 驱动器和接收器，并且采用小型封装，可满足工业应用应用。这些总线引脚可耐受 ESD 事件，具有对于人体放电模型和 IEC 接触放电规范的高级别保护。

其中每一款器件都配有一个差分驱动器和一个差分接收器。这两个器件由 3.3V 单电源供电。驱动器差分输出和接收器差分输入在内部连接，构成一个适用于半双工（两线制总线）通信的总线端口。这些器件具备宽共模电压范围，因此适用于长线缆上的应用长线缆。这些器件额定运行温度范围为 -40°C 至 125°C。

器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸（标称值）
SN65HVD72、 SN65HVD75、 SN65HVD78	SOIC (8)	4.91mm × 3.90mm
	VSSOP (8)	3.00mm × 3.00mm
	VSON (8)	

(1) 要了解所有可用封装，请参见数据表末尾的可订购产品附录。

## 4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

### Changes from Revision G (January 2019) to Revision H Page

•	Changed the Pin Configuration images .....	4
•	Changed Supply voltage, $V_{CC}$ MAX value From = 3.6 V To: 5 V in the <i>Absolute Maximum Ratings</i> table .....	5
•	Deleted "or R pin" for $V_{CC}$ in the <i>Absolute Maximum Ratings</i> .....	5
•	Added reliability note to $V_{CC}$ in the <i>Recommended Operating Conditions</i> table .....	5

### Changes from Revision F (December 2016) to Revision G Page

•	Changed From: Supply voltage, $V_{CC}$ MAX value = 5.5 V To: Supply voltage, $V_{CC}$ or R pin MAX value = 3.6 V in the <i>Absolute Maximum Ratings</i> table .....	5
•	Changed From: Input voltage at any logic pin To: Voltage at D, DE, or $\overline{RE}$ in the <i>Absolute Maximum Ratings</i> table .....	5

### Changes from Revision E (September 2016) to Revision F Page

•	Changed pin A From: 7 To: 6, and pin B From: 6 To: 7 in <a href="#">Figure 26</a> .....	22
---	---	----

### Changes from Revision D (July 2015) to Revision E Page

•	添加了新特性：无干扰加电和断电总线输入和输出 .....	1
---	------------------------------	---

## Changes from Revision C (September 2013) to Revision D Page

• 已添加 引脚配置和功能 部分、ESD 额定值 表、特性 说明 部分、器件功能模式、应用和实施 部分、电源相关建议 部分、布局 部分、器件和文档支持 部分以及机械、封装和可订购信息部分 .....	1
---	---

## Changes from Revision B (June 2012) to Revision C Page

• 删除了特性: > ±12kV IEC61000-4-2 空气间隙放电 .....	1
• Added Footnote 2 to the <i>Absolute Maximum Ratings</i> table .....	5
• Changed the Switching Characteristics conditions statement From: 250 kbps devices (SN65HVD70, 71, 72) bit time > 4 μs To: 250 kbps device (SN65HVD72) bit time ≥ 4 μs .....	7
• Changed the Switching Characteristics conditions statement From: 250 kbps devices (SN65HVD73, 74, 75) bit time > 50 ns To: 250 kbps device (SN65HVD75) bit time ≥ 50 ns .....	8
• Changed the Switching Characteristics conditions statement From: 250 kbps devices (SN65HVD76, 77, 78) bit time > 20 ns To: 250 kbps device (SN65HVD78) bit time ≥ 20 ns .....	8
• Added note : $R_L = 54 \Omega$ to <a href="#">Figure 6</a> , <a href="#">Figure 7</a> , and <a href="#">Figure 8</a> .....	9
• Added the DGK package to the SN65HVD72, 75, 78 Logic Diagram .....	15
• Replaced the LOW-POWER STANDBY MODE section .....	19
• Added text to the Transient Protection section .....	20

## Changes from Revision A (May 2012) to Revision B Page

• Added the SON-8 package and Nodes column to <a href="#">Device Comparison Table</a> .....	4
• Changed the Voltage range at A or B Inputs MIN value From: –8 V To: –13 V in the <i>Absolute Maximum Ratings</i> table ....	5
• Added footnote for free-air temperature to the Recommended Operating Conditions table .....	5
• Changed the Bus input current (disabled driver) TYP values for HVD78 $V_I = 12$ V From: 150 To: 240 and $V_I = -7$ V From: –120 To: –180 .....	7
• Changed, Thermal Information .....	7
• Changed, Thermal Characteristics .....	7
• Added TYP values to the Switching Characteristics table .....	8
• Added TYP values to the Switching Characteristics table .....	8
• Changed the SN65HVD72, 75, 78 Logic Diagram .....	15
• Added section: LOW-POWER STANDBY MODE .....	19

## Changes from Original (March 2012) to Revision A Page

• Added VALUES to the Thermal Characteristics table in the DEVICE INFORMATION section. ....	7
• Changed the Switching Characteristics condition statement From: 15 kbps devices (SN65HVD73, 74, 75) bit time > 65 ns To: 20 Mbps devices (SN65HVD73, 74, 75) bit time > 50 ns .....	8
• Changed the Switching Characteristics condition statement From: 50 kbps devices (SN65HVD76, 77, 78) bit time > 20 ns To: 50 Mbps devices (SN65HVD76, 77, 78) bit time > 20 ns .....	8
• Added <a href="#">Figure 4</a> to <i>Typical Characteristics</i> . ....	9
• Added <a href="#">Figure 5</a> to <i>Typical Characteristics</i> . ....	9
• Added <a href="#">Figure 6</a> to <i>Typical Characteristics</i> . ....	9
• Added <a href="#">Figure 7</a> to <i>Typical Characteristics</i> . ....	9
• Added <a href="#">Figure 8</a> to <i>Typical Characteristics</i> . ....	9
• Added <a href="#">Figure 9</a> to <i>Typical Characteristics</i> . ....	9
• Added <i>Application Information</i> section to data sheet .....	17

## 5 Device Comparison Table

PART NUMBER	SIGNALING RATE	NODES	DUPLEX	ENABLES
SN65HVD72	Up to 250 kbps	213	Half	DE, $\overline{\text{RE}}$
SN65HVD75	Up to 20 Mbps			
SN65HVD78	Up to 50 Mbps	96		

## 6 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NUMBER		
A	6	Bus I/O	Driver output or receiver input (complementary to B)
B	7	Bus I/O	Driver output or receiver input (complementary to A)
D	4	Digital input	Driver data input
DE	3	Digital input	Active-high driver enable
GND	5	Reference potential	Local device ground
R	1	Digital output	Receive data output
$\overline{\text{RE}}$	2	Digital input	Active-low receiver enable
V <sub>CC</sub>	8	Supply	3-V to 3.6-V supply

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over recommended operating range (unless otherwise specified) <sup>(1)</sup>

	MIN	MAX	UNIT
Supply voltage, $V_{CC}$	−0.5	5	V
Voltage at A or B inputs	−13	16.5	
Voltage at D, DE, or $\overline{RE}$	−0.3	5.7	
Voltage input, transient pulse, A and B, through 100 $\Omega$	−100	100	
Receiver output current	−24	24	mA
Junction temperature, $T_J$		170	°C
Continuous total power dissipation	See <a href="#">Power Dissipation</a>		
Storage temperature, $T_{stg}$	−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under [Recommended Operating Conditions](#) is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±8000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101 or ANSI/ESDA/JEDEC JS-002, all pins <sup>(2)</sup>	±1500	
	JEDEC Standard 22, Test Method A115 (Machine Model), all pins	±300	
	IEC 61000-4-2 ESD (Air-Gap Discharge), bus pins and GND <sup>(3)</sup>	±12000	
	IEC 61000-4-2 ESD (Contact Discharge), bus pins and GND	±12000	
	IEC 61000-4-4 EFT (Fast transient or burst) bus pins and GND	±4000	
	IEC 60749-26 ESD (Human Body Model), bus pins and GND	±15000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

- (3) By inference from contact discharge results, see [Application and Implementation](#).

### 7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC}$ <sup>(1)</sup>	Supply voltage	3	3.3	3.6	V
$V_I$	Input voltage at any bus terminal (separately or common mode) <sup>(2)</sup>	−7		12	V
$V_{IH}$	High-level input voltage (driver, driver enable, and receiver enable inputs)	2		$V_{CC}$	V
$V_{IL}$	Low-level input voltage (driver, driver enable, and receiver enable inputs)	0		0.8	V
$V_{ID}$	Differential input voltage	−12		12	V
$I_O$	Output current, driver	−60		60	mA
$I_O$	Output current, receiver	−8		8	mA
$R_L$	Differential load resistance	54	60		$\Omega$
$C_L$	Differential load capacitance		50		pF
$1/t_{UI}$	Signaling rate	SN65HVD72		250	kbps
		SN65HVD75		20	Mbps
		SN65HVD78		50	Mbps
$T_A$ <sup>(3)</sup>	Operating free-air temperature (See <a href="#">Thermal Information</a> )	−40		125	°C
$T_J$	Junction temperature	−40		150	°C

- (1) Exposure to conditions beyond the recommended operation maximum for extended periods may affect device reliability.

- (2) The algebraic convention, in which the least positive (most negative) limit is designated as minimum, is used in this data sheet.

- (3) Operation is specified for internal (junction) temperatures up to 150°C. Self-heating due to internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shutdown (TSD) circuit which disables the driver outputs when the junction temperature reaches 170°C.

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		SN65HVD72, SN65HVD75, SN65HVD78			UNIT
		D (SOIC)	DGK (VSSOP)	DRB (VSON)	
		8 PINS			
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	110.7	168.7	40	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	54.7	62.2	49.6	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	—	—	3.9	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	51.3	89.5	15.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	9.2	7.4	0.6	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	50.7	87.9	15.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

over recommended operating range (unless otherwise specified)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$ V_{OD} $ Driver differential output voltage magnitude	$R_L = 60\ \Omega$ , 375 $\Omega$ on each output to –7 V to 12 V	1.5	2		V
	$R_L = 54\ \Omega$ (RS-485)	1.5	2		
	$R_L = 100\ \Omega$ (RS-422), $T_J \geq 0^\circ\text{C}$ $V_{CC} \geq 3.2\ \text{V}$	2	2.5		
$\Delta V_{OD} $ Change in magnitude of driver differential output voltage	$R_L = 54\ \Omega$ , $C_L = 50\ \text{pF}$	–50	0	50	mV
$V_{OC(SS)}$ Steady-state common-mode output voltage	Center of two 27- $\Omega$ load resistors	1	$V_{CC}/2$	3	V
$\Delta V_{OC}$ Change in differential driver output common-mode voltage	Center of two 27- $\Omega$ load resistors	–50	0	50	mV
$V_{OC(PP)}$ Peak-to-peak driver common-mode output voltage	Center of two 27- $\Omega$ load resistors		200		mV
$C_{OD}$ Differential output capacitance			15		pF
$V_{IT+}$ Positive-going receiver differential input voltage threshold		See <sup>(1)</sup>	–70	–20	mV
$V_{IT-}$ Negative-going receiver differential input voltage threshold		–200	–150	See <sup>(1)</sup>	mV
$V_{HYS}$ Receiver differential input voltage threshold hysteresis ( $V_{IT+} - V_{IT-}$ )		50	80		mV
$V_{OH}$ Receiver high-level output voltage	$I_{OH} = -8\ \text{mA}$	2.4	$V_{CC} - 0.3$		V
$V_{OL}$ Receiver low-level output voltage	$I_{OL} = 8\ \text{mA}$		0.2	0.4	V
$I_I$ Driver input, driver enable, and receiver enable input current		–2		2	$\mu\text{A}$
$I_{OZ}$ Receiver output high-impedance current	$V_O = 0\ \text{V}$ or $V_{CC}$ , $\overline{RE}$ at $V_{CC}$	–1		1	$\mu\text{A}$
$I_{OS}$ Driver short-circuit output current		–160		160	mA

(1) Under any specific conditions,  $V_{IT+}$  is assured to be at least  $V_{HYS}$  higher than  $V_{IT-}$ .

## Electrical Characteristics (continued)

over recommended operating range (unless otherwise specified)

PARAMETER		TEST CONDITIONS			MIN	TYP	MAX	UNIT
I <sub>I</sub>	Bus input current (disabled driver)	V <sub>CC</sub> = 3 to 3.6 V or V <sub>CC</sub> = 0 V DE at 0 V	SN65HVD72	V <sub>I</sub> = 12 V		75	150	μA
			SN65HVD75	V <sub>I</sub> = −7 V	−100	−40		
			SN65HVD78	V <sub>I</sub> = 12 V		240	333	
				V <sub>I</sub> = −7 V	−267	−180		
I <sub>CC</sub>	Supply current (quiescent)	Driver and receiver enabled	DE = V <sub>CC</sub> , $\overline{\text{RE}}$ = GND No load			750	950	μA
		Driver enabled, receiver disabled	DE = V <sub>CC</sub> , $\overline{\text{RE}}$ = V <sub>CC</sub> No load			300	500	
		Driver disabled, receiver enabled	DE = GND, $\overline{\text{RE}}$ = GND No load			600	800	
		Driver and receiver disabled	$\overline{\text{DE}}$ = GND, D = open $\overline{\text{RE}}$ = V <sub>CC</sub> , No load			0.1	2	
Supply current (dynamic)		See <i>Typical Characteristics</i>						
T <sub>TSD</sub>	Thermal shutdown junction temperature				170			°C

## 7.6 Power Dissipation

PARAMETER		TEST CONDITIONS		VALUE	UNIT	
PD	Power Dissipation driver and receiver enabled, V <sub>CC</sub> = 3.6 V, T <sub>J</sub> = 150°C 50% duty cycle square-wave signal at signaling rate: <ul style="list-style-type: none"><li>• SN65HVD72 at 250 kbps</li><li>• SN65HVD75 at 20 Mbps</li><li>• SN65HVD78 at 50 Mbps</li></ul>	Unterminated	R <sub>L</sub> = 300 Ω C <sub>L</sub> = 50 pF (driver)	SN65HVD72	120	mW
				SN65HVD75	160	
				SN65HVD78	200	
		RS-422 load	R <sub>L</sub> = 100 Ω C <sub>L</sub> = 50 pF (driver)	SN65HVD72	155	mW
				SN65HVD75	195	
				SN65HVD78	230

				SN65HVD75	230	
				SN65HVD78	260	

## 7.7 Switching Characteristics: 250 kbps Device (SN65HVD72) Bit Time $\geq 4\ \mu$ s

over recommended operating conditions

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
DRIVER							
t <sub>r</sub> , t <sub>f</sub>	Driver differential output rise or fall time	R <sub>L</sub> = 54 Ω C <sub>L</sub> = 50 pF	See <a href="#">Figure 12</a>	0.3	0.7	1.2	μs
t <sub>PHL</sub> , t <sub>PLH</sub>	Driver propagation delay				0.7	1	μs
t <sub>SK(P)</sub>	Driver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>					0.2	μs
t <sub>PHZ</sub> , t <sub>PLZ</sub>	Driver disable time		See <a href="#">Figure 13</a> and <a href="#">Figure 14</a>		0.1	0.4	μs
t <sub>PZH</sub> , t <sub>PZL</sub>	Driver enable time	Receiver enabled			0.5	1	μs
		Receiver disabled			3	9	
RECEIVER							
t <sub>r</sub> , t <sub>f</sub>	Receiver output rise or fall time	C <sub>L</sub> = 15 pF	See <a href="#">Figure 15</a>		12	30	ns
t <sub>PHL</sub> , t <sub>PLH</sub>	Receiver propagation delay time				75	100	ns
t <sub>SK(P)</sub>	Receiver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>				3	15	ns
t <sub>PLZ</sub> , t <sub>PHZ</sub>	Receiver disable time				40	100	ns
t <sub>PZL(1)</sub> , t <sub>PZH(1)</sub> , t <sub>PZL(2)</sub> , t <sub>PZH(2)</sub>	Receiver enable time	Driver enabled	See <a href="#">Figure 16</a>		20	50	ns
		Driver disabled	See <a href="#">Figure 17</a>		3	8	μs

## 7.8 Switching Characteristics: 20 Mbps Device (SN65HVD75) Bit Time $\geq 50$ ns

over recommended operating conditions

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
DRIVER							
t <sub>r</sub> , t <sub>f</sub>	Driver differential output rise or fall time	R <sub>L</sub> = 54 Ω C <sub>L</sub> = 50 pF	See Figure 12	2	7	14	ns
t <sub>PHL</sub> , t <sub>PLH</sub>	Driver propagation delay			7	11	17	ns
t <sub>SK(P)</sub>	Driver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>				0	2	ns
t <sub>PHZ</sub> , t <sub>PLZ</sub>	Driver disable time		See Figure 13 and Figure 14		12	50	ns
t <sub>PZH</sub> , t <sub>PZL</sub>	Driver enable time	Receiver enabled			10	20	ns
		Receiver disabled				3	7
RECEIVER							
t <sub>r</sub> , t <sub>f</sub>	Receiver output rise or fall time	C <sub>L</sub> = 15 pF	See Figure 15		5	10	ns
t <sub>PHL</sub> , t <sub>PLH</sub>	Receiver propagation delay time				60	70	ns
t <sub>SK(P)</sub>	Receiver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>				0	6	ns
t <sub>PLZ</sub> , t <sub>PHZ</sub>	Receiver disable time				15	30	ns
t <sub>pZL(1)</sub> , t <sub>pZH(1)</sub> , t <sub>pZL(2)</sub> , t <sub>pZH(2)</sub>	Receiver enable time	Driver enabled	See Figure 16		10	50	ns
		Driver disabled	See Figure 17		3	8	µs

## 7.9 Switching Characteristics: 50 Mbps Device (SN65HVD78) Bit Time $\geq 20$ ns

over recommended operating conditions

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
DRIVER							
t <sub>r</sub> , t <sub>f</sub>	Driver differential output rise or fall time	R <sub>L</sub> = 54 Ω C <sub>L</sub> = 50 pF	See Figure 12	1	3	6	ns
t <sub>PHL</sub> , t <sub>PLH</sub>	Driver propagation delay				9	15	ns
t <sub>SK(P)</sub>	Driver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>				0	1	ns
t <sub>PHZ</sub> , t <sub>PLZ</sub>	Driver disable time		See Figure 13 and Figure 14		10	30	ns
t <sub>PZH</sub> , t <sub>PZL</sub>	Driver enable time	Receiver enabled			10	30	ns
		Receiver disabled				8	μs
RECEIVER							
t <sub>r</sub> , t <sub>f</sub>	Receiver output rise or fall time	C <sub>L</sub> = 15 pF	See Figure 15	1	3	6	ns
t <sub>PHL</sub> , t <sub>PLH</sub>	Receiver propagation delay time					35	ns
t <sub>SK(P)</sub>	Receiver pulse skew,  t <sub>PHL</sub> – t <sub>PLH</sub>					2.5	ns
t <sub>PLZ</sub> , t <sub>PHZ</sub>	Receiver disable time				8	30	ns
t <sub>pZL(1)</sub> , t <sub>pZH(1)</sub> , t <sub>pZL(2)</sub> , t <sub>pZH(2)</sub>	Receiver enable time	Driver enabled	See Figure 16		10	30	ns
		Driver disabled	See Figure 17		3	8	μs

## 7.10 Typical Characteristics

## 9 Detailed Description

### 9.1 Overview

The SN65HVD72, SN65HVD75, and SN65HVD78 are low-power, half-duplex RS-485 transceivers available in 3 speed grades suitable for data transmission up to 250 kbps, 20 Mbps, and 50 Mbps.

These devices have active-high driver enables and active-low receiver enables. A standby current of less than 2  $\mu$ A can be achieved by disabling both driver and receiver.

### 9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

### 9.3 Feature Description

Internal ESD protection circuits protect the transceiver against electrostatic discharges (ESD) according to IEC 61000-4-2 of up to  $\pm 12$  kV, and against electrical fast transients (EFT) according to IEC 61000-4-4 of up to  $\pm 4$  kV.

The SN65HVD7x half-duplex family provides internal biasing of the receiver input thresholds in combination with large input threshold hysteresis. At a positive input threshold of  $V_{IT+} = -20$  mV and an input hysteresis of  $V_{HYS} = 50$  mV, the receiver output remains logic high under a bus-idle or bus-short condition even in the presence of 140-mV<sub>pp</sub> differential noise without the need for external failsafe biasing resistors.

Device operation is specified over a wide ambient temperature range from  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

### 9.4 Device Functional Modes

When the driver enable pin, DE, is logic high, the differential outputs A and B follow the logic states at data input D. A logic high at D causes A to turn high and B to turn low. In this case the differential output voltage defined as  $V_{OD} = V_A - V_B$  is positive. When D is low, the output states reverse, B turns high, A becomes low, and  $V_{OD}$  is negative.

When DE is low, both outputs turn high-impedance. In this condition the logic state at D is irrelevant. The DE pin has an internal pulldown resistor to ground; thus, when left open, the driver is disabled (high-impedance) by default. The D pin has an internal pullup resistor to  $V_{CC}$ ; thus, when left open while the driver is enabled, output A turns high and B turns low.

**Table 1. Driver Function Table**

INPUT	ENABLE	OUTPUTS		DESCRIPTION
D	DE	A	B	
H	H	H	L	Actively drive bus high
L	H	L	H	Actively drive bus low
X	L	Z	Z	Driver disabled
X	OPEN	Z	Z	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

When the receiver enable pin,  $\overline{RE}$ , is logic low, the receiver is enabled. When the differential input voltage defined as  $V_{ID} = V_A - V_B$  is positive and higher than the positive input threshold,  $V_{IT+}$ , the receiver output, R, turns high. When  $V_{ID}$  is negative and lower than the negative input threshold,  $V_{IT-}$ , the receiver output turns low. If  $V_{ID}$  is between  $V_{IT+}$  and  $V_{IT-}$ , the output is indeterminate.

When  $\overline{RE}$  is logic high or left open, the receiver output is high-impedance and the magnitude and polarity of  $V_{ID}$  are irrelevant. Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted (short-circuit), or the bus is not actively driven (idle bus).

**Table 2. Receiver Function Table**

DIFFERENTIAL INPUT	ENABLE	OUTPUT	DESCRIPTION
$V_{ID} = V_A - V_B$	$\overline{RE}$	R	
$V_{IT+} < V_{ID}$	L	H	Receive valid bus high
$V_{IT-} < V_{ID} < V_{IT+}$	L	?	Indeterminate bus state
$V_{ID} < V_{IT-}$	L	L	Receive valid bus low
X	H	Z	Receiver disabled
X	OPEN	Z	Receiver disabled by default
Open-circuit bus	L	H	Failsafe high output
Short-circuit bus	L	H	Failsafe high output
Idle (terminated) bus	L	H	Failsafe high output

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

The SN65HVD72, SN65HVD75, and SN65HVD78 are half-duplex RS-485 transceivers commonly used for asynchronous data transmission. The driver and receiver enable pins allow for the configuration of different operating modes.

Copyright © 2016, Texas Instruments Incorporated

**Figure 19. Transceiver Configurations**

Using independent enable lines provides the most flexible control as it allows for the driver and the receiver to be turned on and off individually. While this configuration requires two control lines, it allows for selective listening into the bus traffic, whether the driver is transmitting data or not.

Combining the enable signals simplifies the interface to the controller by forming a single direction-control signal. In this configuration, the transceiver operates as a driver when the direction-control line is high, and as a receiver when the direction-control line is low.

Additionally, only one line is required when connecting the receiver-enable input to ground and controlling only the driver-enable input. In this configuration, a node not only receives the data from the bus, but also the data it sends and can verify that the correct data have been transmitted.

## 10.2 Typical Application

An RS-485 bus consists of multiple transceivers connected in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor,  $R_T$ , whose value matches the characteristic impedance,  $Z_0$ , of the cable. This method, known as parallel termination, allows for relatively high data rates over long cable lengths.

Copyright © 2016, Texas Instruments Incorporated

**Figure 20. Typical RS-485 Network With SN65HVD7x Transceivers**

Common cables used are unshielded twisted pair (UTP), such as low-cost CAT-5 cable with  $Z_0 = 100\ \Omega$ , and RS-485 cable with  $Z_0 = 120\ \Omega$ . Typical cable sizes are AWG 22 and AWG 24.

The maximum bus length is typically given as 4000 ft or 1200 m, and represents the length of an AWG 24 cable whose cable resistance approaches the value of the termination resistance, thus reducing the bus signal by half or 6 dB. Actual maximum usable cable length depends on the signaling rate, cable characteristics, and environmental conditions.

### 10.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes.

#### 10.2.1.1 Data Rate and Bus Length

There is an inverse relationship between data rate and bus length, meaning the higher the data rate, the shorter the cable length; and conversely, the lower the data rate, the longer the cable may be without introducing data errors. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 250 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

**Figure 21. Cable Length vs Data Rate Characteristic**

## Typical Application (continued)

### 10.2.1.2 Stub Length

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in [Equation 1](#).

$$L_{\text{stub}} \leq 0.1 \times t_r \times v \times c$$

where:

- $t_r$  is the 10/90 rise time of the driver
  - $c$  is the speed of light ( $3 \times 10^8$  m/s)
  - $v$  is the signal velocity of the cable or trace as a factor of  $c$
- (1)

Per [Equation 1](#), [Table 3](#) shows the maximum cable-stub lengths for the minimum driver output rise times of the SN65HVD7x half-duplex family of transceivers for a signal velocity of 78%.

**Table 3. Maximum Stub Length**

DEVICE	MINIMUM DRIVER OUTPUT RISE TIME (ns)	MAXIMUM STUB LENGTH	
		(m)	(ft)
SN65HVD72	300	7	23
SN65HVD75	2	0.05	0.16
SN65HVD78	1	0.025	0.08

### 10.2.1.3 Bus Loading

The RS-485 standard specifies that a compliant driver must be able to drive 32 unit loads (UL), where 1 unit load represents a receiver input current of 1 mA at 12 V, or a load impedance of approximately 12 kΩ. Because the SN65HVD72 and SN65HVD75 have a receiver input current of 150 μA at 12 V, they are 3/20 UL transceivers, and no more than 213 transceivers should be connected to the bus. Similarly, the SN65HVD78 has a receiver input current of 333 μA at 12 V and is a 1/3 UL transceiver, meaning no more than 96 transceivers should be connected to the bus.

### 10.2.1.4 Receiver Failsafe

The differential receiver is failsafe to invalid bus states caused by:

- Open bus conditions such as a disconnected connector
- Shorted bus conditions such as cable damage shorting the twisted-pair together, or
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver will output a failsafe logic high so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the input-indeterminate range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input  $V_{ID}$  is more positive than 200 mV, and must output a low when  $V_{ID}$  is more negative than –200 mV. The receiver parameters which determine the failsafe performance are  $V_{IT+}$ ,  $V_{IT-}$ , and  $V_{HYS}$  (the separation between  $V_{IT+}$  and  $V_{IT-}$ ). As shown in [Electrical Characteristics](#), differential signals more negative than –200 mV will always cause a low receiver output, and differential signals more positive than 200 mV will always cause a high receiver output.

When the differential input signal is close to zero, it is still above the maximum  $V_{IT+}$  threshold of –20 mV, and the receiver output will be high. Only when the differential input is more than  $V_{HYS}$  below  $V_{IT+}$  will the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault condition includes the receiver hysteresis value,  $V_{HYS}$ , as well as the value of  $V_{IT+}$ .

Figure 22. SN65HVD7x Noise Immunity

### 10.2.1.5 Transient Protection

The bus pins of the SN65HVD7x transceiver family possess on-chip ESD protection against  $\pm 15$ -kV human body model (HBM) and  $\pm 12$ -kV IEC 61000-4-2 contact discharge. The IEC-ESD test is far more severe than the HBM-ESD test. The 50% higher charge capacitance,  $C_S$ , and 78% lower discharge resistance,  $R_D$ , of the IEC-model produce significantly higher discharge currents than the HBM-model.

As stated in the IEC 61000-4-2 standard, contact discharge is the preferred test method; although IEC air-gap testing is less repeatable than contact testing, air discharge protection levels are inferred from the contact discharge test results.

Copyright © 2016, Texas Instruments Incorporated

Figure 23. HBM and IEC-ESD Models and Currents in Comparison (HBM Values in Parenthesis)

The on-chip implementation of IEC ESD protection significantly increases the robustness of equipment. Common discharge events occur due to human contact with connectors and cables. Designers may choose to implement protection against longer duration transients, typically referred to as surge transients.

EFTs are generally caused by relay-contact bounce or the interruption of inductive loads. Surge transients often result from lightning strikes (direct strike or an indirect strike which induce voltages and currents), or the switching of power systems, including load changes and short circuit switching. These transients are often encountered in industrial environments, such as factory automation and power-grid systems.

Figure 24 compares the pulse-power of the EFT and surge transients with the power caused by an IEC ESD transient. The left-hand diagram shows the relative pulse-power for a 0.5-kV surge transient and 4-kV EFT transient, both of which dwarf the 10-kV ESD transient visible in the lower-left corner. 500-V surge transients are representative of events that may occur in factory environments in industrial and process automation.

The right-hand diagram shows the pulse-power of a 6-kV surge transient, relative to the same 0.5-kV surge transient. 6-kV surge transients are most likely to occur in power generation and power-grid systems.

**Figure 24. Power Comparison of ESD, EFT, and Surge Transients**

In the case of surge transients, high-energy content is characterized by long pulse duration and slow decaying pulse power. The electrical energy of a transient that is dumped into the internal protection cells of a transceiver is converted into thermal energy which heats and destroys the protection cells, thus destroying the transceiver. Figure 25 shows the large differences in transient energies for single ESD, EFT, and surge transients, as well as for an EFT pulse train, commonly applied during compliance testing.

**Figure 25. Comparison of Transient Energies**

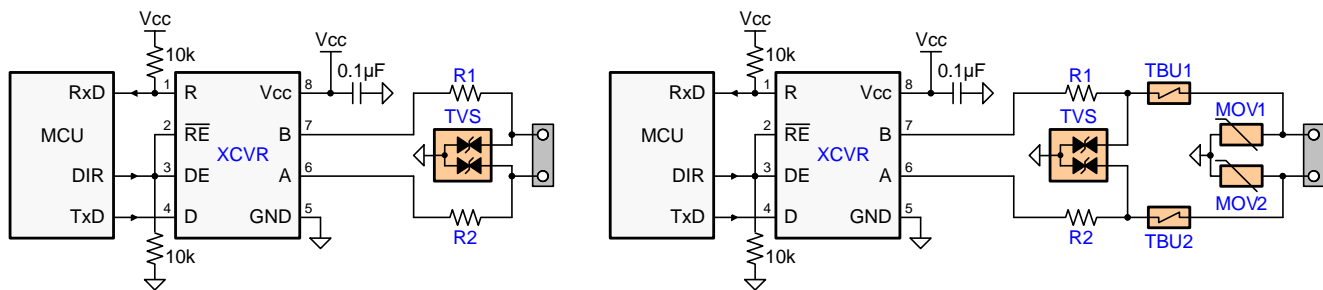

## 10.2.2 Detailed Design Procedure

### 10.2.2.1 External Transient Protection

To protect bus nodes against high-energy transients, the implementation of external transient protection devices is necessary. Figure 26 suggests two circuits that provide protection against light and heavy surge transients, in addition to ESD and EFT transients. Table 4 presents the associated bill of materials.

**Table 4. Bill of Materials**

DEVICE	FUNCTION	ORDER NUMBER	MANUFACTURER
XCVR	3.3-V, 250-kbps RS-485 Transceiver	SN65HVD72D	TI
R1, R2	10-Ω, Pulse-Proof Thick-Film Resistor	CRCW060310RJNEAHP	Vishay
TVS	Bidirectional 400-W Transient Suppressor	CDSOT23-SM712	Bourns
TBU1, TBU2	Bidirectional Surge Suppressor	TBU-CA-065-200-WH	Bourns
MOV1, MOV2	200-mA Transient Blocking Unit, 200-V, Metal-Oxide Varistor	MOV-10D201K	Bourns

Copyright © 2016, Texas Instruments Incorporated

**Figure 26. Transient Protections Against ESD, EFT, and Surge Transients**

The left-hand circuit provides surge protection of  $\geq 500$ -V surge transients, while the right-hand circuit can withstand surge transients of up to 5 kV.

### 10.2.2.2 Isolated Bus Node Design

Many RS-485 networks use isolated bus nodes to prevent the creation of unintended ground loops and their disruptive impact on signal integrity. An isolated bus node typically includes a microcontroller that connects to the bus transceiver via a multi-channel, digital isolator (Figure 27).

Copyright © 2016, Texas Instruments Incorporated

**Figure 27. Isolated Bus Node with Transient Protection**

Power isolation is accomplished using the push-pull transformer driver SN6501 and a low-cost LDO, TLV70733.

Signal isolation uses the quadruple digital isolator ISO7241. Notice that both enable inputs,  $EN_1$  and  $EN_2$ , are pulled up via 4.7 k $\Omega$  resistors to limit their input currents during transient events.

While the transient protection is similar to the one in Figure 26 (left circuit), an additional high-voltage capacitor is used to divert transient energy from the floating RS-485 common further towards Protective Earth (PE) ground. This is necessary as noise transients on the bus are usually referred to Earth potential.

$R_{HV}$  refers to a high voltage resistor, and in some applications even a varistor. This resistance is applied to prevent charging of the floating ground to dangerous potentials during normal operation.

Occasionally varistors are used instead of resistors to rapidly discharge  $C_{HV}$ , if it is expected that fast transients might charge  $C_{HV}$  to high-potentials.

Note that the PE island represents a copper island on the PCB for the provision of a short, thick Earth wire connecting this island to PE ground at the entrance of the power supply unit (PSU).

In equipment designs using a chassis, the PE connection is usually provided through the chassis itself. Typically the PE conductor is tied to the chassis at one end while the high-voltage components,  $C_{HV}$  and  $R_{HV}$ , are connecting to the chassis at the other end.

### 10.2.3 Application Curves

## 11 Power Supply Recommendations

To assure reliable operation at all data rates and supply voltages, each supply should be buffered with a 100-nF ceramic capacitor located as close to the supply pins as possible. The TPS76333 is a linear voltage regulator suitable for the 3.3 V supply.

See the [SN6501](#) data sheet for isolated power supply designs.

## 12 Layout

### 12.1 Layout Guidelines

On-chip IEC ESD protection is sufficient for laboratory and portable equipment but often insufficient for EFT and surge transients occurring in industrial environments. Therefore, robust and reliable bus node design requires the use of external transient protection devices.

Because ESD and EFT transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high-frequency layout techniques must be applied during PCB design.

For a successful PCB design, start with the design of the protection circuit in mind.

1. Place the protection circuitry close to the bus connector to prevent noise transients from entering the board.
2. Use  $V_{CC}$  and ground planes to provide low-inductance. Note that high-frequency currents follow the path of least inductance and not the path of least impedance.
3. Design the protection components into the direction of the signal path. Do not force the transients currents to divert from the signal path to reach the protection device.
4. Apply 100-nF to 220-nF bypass capacitors as close as possible to the  $V_{CC}$  pins of transceiver, UART, and controller ICs on the board.
5. Use at least two vias for  $V_{CC}$  and ground connections of bypass capacitors and protection devices to minimize effective via-inductance.
6. Use 1-k $\Omega$  to 10-k $\Omega$  pullup or pulldown resistors for enable lines to limit noise currents in these lines during transient events.
7. Insert pulse-proof series resistors into the A and B bus lines if the TVS clamping voltage is higher than the specified maximum voltage of the transceiver bus pins. These resistors limit the residual clamping current into the transceiver and prevent it from latching up.
8. While pure TVS protection is sufficient for surge transients up to 1 kV, higher transients require metal-oxide varistors (MOVs) which reduce the transients to a few hundred volts of clamping voltage, and transient blocking units (TBUs) that limit transient current to 200 mA.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**GENERIC PACKAGE VIEW**

**VSON - 1 mm max height**

PLASTIC SMALL OUTLINE - NO LEAD

Images above are just a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4203482/L

## PACKAGE OUTLINE

**VSON - 1 mm max height**

PLASTIC SMALL OUTLINE - NO LEAD

4218876/A 12/2017

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

DRB0008B

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

LAND PATTERN EXAMPLE  
SCALE:20X

SOLDER MASK DETAILS

4218876/A 12/2017

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slue271](http://www.ti.com/lit/slue271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

DRB0008B

VSON - 1 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD  
81% PRINTED SOLDER COVERAGE BY AREA  
SCALE:25X

4218876/A 12/2017

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

**D0008A**

# PACKAGE OUTLINE

**SOIC - 1.75 mm max height**

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

## NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

**D0008A**

## SOIC - 1.75 mm max height

## SMALL OUTLINE INTEGRATED CIRCUIT

## SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

## EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE  
BASED ON .005 INCH [0.125 MM] THICK STENCIL  
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

DGK (S-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

## NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## 重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。
